

BASE AR37 TOPS DAIRY AUSTRALIA'S FORAGE VALUE INDEX FOR SIX CONSECUTIVE YEARS.

Base AR37 tetraploid perennial ryegrass from DLF Seeds has again come out on top of Dairy Australia's latest Australian Forage Value Index (FVI) 2023 update.

The FVI rating system helps Australian dairy producers make better-informed decisions when choosing a perennial ryegrass cultivar. It provides an accurate, reliable and independent assessment of the potential economic benefit of perennial ryegrass cultivars in different dairy regions of southeast Australia.

The FVI is calculated by multiplying a cultivar's dry matter performance value (PV) by its economic value (EV), and Base AR37 perennial ryegrass topped the rankings across all four areas tested in Southwest Victoria, Gippsland (VIC), Northern Victoria and Tasmania for 2023.

Jason Agars, DLF Seeds National Sales and Marketing Manager says *"This is a fantastic result, once again for Base AR37. This result, coupled with the fact that it's Australian bred, really demonstrates its value to Australian farmers. The performance of Base AR37 in our conditions is exceptional and its fit across farming systems in southern Australia continues to expand. In the current environment, with strong milk and red meat markets, it makes a lot of sense to choose the variety that will drive the most productivity"*.

AR37 endophyte provides Base with the best balance of pasture production and persistence, insect control, higher tiller density over time and increased total dry matter production compared to ryegrass cultivars containing AR1 or nil endophyte.

Isaac Berry, National Product Development Manager says *"AR37 really takes ryegrass pasture persistence to a premium level providing protection against Argentine Stem weevil, Pasture Mealy Bug, African Black Beetle and Root Aphid. Autumn recovery is a true standout for Base AR37, and this can be attributed to AR37 providing protection during critical times allowing Base to maintain a high tiller density and recover faster when the autumn break occurs"*.

Tim Calder, a Dairy farmer from Meeniyan Victoria states *"Several years ago, African Black Beetle appeared on our farm decimating our Italian and some permanent ryegrass pastures which brought about a change in pasture variety selection on our farm. I wanted a tetraploid perennial that was persistent, palatable and responsive to summer and early autumn rains. Having evaluated several varieties on our farm, I now use Base AR37 perennial ryegrass almost exclusively in our pasture improvement programme. A particular feature of it is its persistency, (I have many paddocks untouched for over 5 years) and its ability to maintain feed quality into the early summer. It has also been a reliable performer in producing good quality silage in large quantities with up to 3 cuts on some out paddocks."*

Base AR37 is Australian bred for Australian conditions and has been the number 1 performer in the FVI for six consecutive years from 2018 through to 2023. Ultimately, the superb dry matter yield Base offers coupled with premium insect control means more feed is available for your stock and persistence is optimised.
